

Take Home Task: Quality Engineer (Mid / Senior)

Thank you for applying to our QA Engineer (Mid / Senior) position at Adjust!

Below, you will find three challenges that we would like you to work on. We're looking forward to seeing your skills put into action, and the test will also offer you more insights on the role and industry that we operate in.

Best of luck!

Task 1

- Please go to <https://en.wikipedia.org/w/index.php?search> and do some exploratory testing.
- At the end of your test please create a brief Exploratory Test Charter.
- Remember that a comprehensive test is not only about functionality.
- Feel free to advise on the possible improvements, not just the bugs.

Task 2

Please submit 2 UI automation scenarios of your choice using the previous website <https://en.wikipedia.org/w/index.php?search>

Please describe your scenarios and why you chose to implement them, and then walk us through how you implemented them.

Task 3

Please write a few automation tests (up to 5) for the api provided at <https://petstore.swagger.io/>.

Tools for performing the tasks: Feel free to use any automation tools that you're comfortable with and please let us know why you chose to use them.

If there are any instructions needed for running your tests, kindly provide them in a readme file, including how to set up your dependencies for running the tests.

Delivery Format

Once done, please send us your solution as a **GitHub project** through the **Greenhouse link** found at the bottom of the task email. Kindly make your repo public so that the team can access it, but don't mention anywhere that it's a part of the Adjust recruiting process. ;)

Thank you!
